

## FEATURES

- Dropout Voltage 1.2V at 800mA Output Current.
- Fast Transient Response.
- Line Regulation, typical at 0.015%.
- Load Regulation, typical at 0.1%.
- Current Limiting and Thermal Protection.
- Adjustable Output Voltage or Fixed at 1.8V, 2.5V and 3.3V.
- Standard 3-Pin Power Packages.

## APPLICATIONS

- Active SCSI Terminators.
- Post Regulators for Switching Supplies.
- Battery Chargers.
- PC Add-On Card.

## DESCRIPTION

The AIC1117 is a low dropout, three terminals regulator designed to provide output current up to 800mA. The device is available in an adjustable version and fixed output voltage of 1.8V, 2.5V and 3.3V. Dropout voltage of maximum of 1.4V is guaranteed at 800mA output current. The quality of low dropout voltage and fast transient response make this device ideal for low voltage microprocessor applications.

The AIC1117 requires output capacitance of a minimum of 10 $\mu$ F for stability. Built-in output current limiting and thermal limiting provide maximal protection to the AIC1117 against fault conditions.

## TYPICAL APPLICATION CIRCUIT

**Adjustable Voltage Regulator**

**Fixed Voltage Regulator**

$$V_{REF} = V_{OUT} - V_{ADJ} = 1.25V \text{ (typ.)}$$

$$V_{OUT} = V_{REF} \times (1 + RF2/RF1) + I_{ADJ} \times RF2$$

$$I_{ADJ} = 55\mu A \text{ (typ.)}$$

- (1) C1 needed if device is far away from filter capacitors.
- (2) C2 required for stability.

## ORDERING INFORMATION

AIC1117-XXXXXX

Example: AIC1117-25GETR  
 → 2.5V version in TO-252 Green Package & Taping & Reel Packing Type  
 AIC1117-25PYTR  
 → 2.5V version in SOT-223 Lead Free Package & Taping & Reel

### SOT-223 Marking

■ PIN DESCRIPTIONS

- ADJ PIN - Providing  $V_{REF}=1.25V$  (typ.) for adjustable  $V_{OUT}$ .  $V_{REF}=V_{OUT}-V_{ADJ}$  and  $I_{ADJ}=55\mu A$  (typ.) (GND PIN - Power ground.)
- VOUT PIN - Adjustable output voltage.
- VIN PIN - Power Input.

## APPLICATION INFORMATION

### INPUT-OUTPUT CAPACITORS

Linear regulators require input and output capacitors to maintain stability. Input capacitor at 10 $\mu$ F with a 10 $\mu$ F aluminum electrolytic output capacitor is recommended. To avoid oscillation, it is recommended to follow Fig. 8, 9 to choose proper capacitor specifications.

### POWER DISSIPATION

The AIC1117 obtains thermal-limiting circuitry, which is designed to protect the device against overload condition. For continuous load condition, maximum rating of junction temperature must not be exceeded. It is important to pay more attention in thermal resistance. It includes junction to case, junction to ambient. The maximum power dissipation of AIC1117 depends on the thermal resistance of its case and circuit board, the temperature difference between the die junction and ambient air, and the rate of airflow. The rate of

temperature rise is greatly affected by the mounting pad configuration on the PCB, the board material, and the ambient temperature. When the IC mounting with good thermal conductivity is used, the junction temperature will be low even when large power dissipation applies.

The power dissipation across the device is

$$P = I_{OUT} (V_{IN} - V_{OUT}).$$

The maximum power dissipation is:

$$P_{MAX} = \frac{(T_{J-max} - T_A)}{R\theta_{JA}}$$

Where  $T_{J-max}$  is the maximum allowable junction temperature (125°C), and  $T_A$  is the ambient temperature suitable in application.

As a general rule, the lower temperature is, the better reliability of the device is. So the PCB mounting pad should provide maximum thermal conductivity to maintain low device temperature.
