ONE-CHANNEL STEP-UP PWM CONTROLLER

FEATURES

- Under-Voltage Lockout (UVLO) Protection
- Totem Pole Output
- Output Short Circuit Protection
- Soft-Start Function
- Wide Operating Frequency :
10 kHz to 1MHz
- Shutdown Control
- Low Dissipation Current :
Typical 1.6mA in Operation
- SOP-8 Package Available

GENERAL DESCRIPTION

The CT1102 is a one-channel step-up PWM controller incorporating a soft-start and a short circuit protection (SCP) function.

This device consists of an on-chip voltage reference, error amplifier, pulse width modulation controller, under-voltage lockout protection, soft-start, and short circuit protection circuits. Switching frequency up to 1MHz is set by an external resistor and capacitor. Soft-start time can be implemented by the SCP capacitor.

Additionally, a chip-enable feature is also provided to power down and reduce the current supply to 10 μ A. With the minimal external components, the CT1102 offers a simple and economical solution.

HOW TO SET THE TIME CONSTANT FOR SOFT-START AND SHORT CIRCUIT PROTECTION

1. Soft-Start

CT1102 operates in soft-start mode. The PWM comparator monitors the voltage at soft-start setting and SCP pin, which varies proportionally to each other. This proportion relation controls the ON duty of the OUT pin and activates the soft-start operation. In the Soft-start mode, the voltage at SCP pin (V_{SCP}) is input to the PWM comparator, so that the ON duty of the OUT pin is determined by the V_{SCP} . When the soft-started mode is completed, its setting voltage remains high and the circuit enters the output short circuit protection wait state while V_{SCP} remains low.

Soft-Start Time

$$t_s(sec) \sim 0.84 \times C_{SCP}(\mu F)$$

2. Short Circuit Protection

In response to a sudden drop of the switching regulator output, the device locks the error amplifier, OE pin, at V_{OS+} , and starts feeding currents into the capacitor at SCP pin to achieve in a voltage value of approximately 0.84V at this pin. This chain reaction protects the circuit by keeping the SCP pin and output pin low. Users could reverse this process by restarting the device.

Short Circuit Detection Time

$$t_{SCP}(sec) \sim 0.84 \times C_{SCP}(\mu F)$$
