

DESCRIPTIONS

OB6561P is an active transition-mode (TM) power factor correction (PFC) controller for AC-DC switching mode power supply applications.

OB6561P features an internal start-up timer for stand-alone applications, a one quadrant multiplier with THD optimizer for near unity power factor, zero current detector (ZCD) to ensure TM operation, a current sensing comparator with built-in leading-edge blanking, and a totem pole output ideally suited for driving a power MOSFET.

OB6561P offers great protection coverage including system over-voltage protection (OVP) to eliminate runaway output voltage due to load removal, VCC under voltage lockout (UVLO), cycle-by-cycle current limiting, multiplier output clamping that limit maximum peak switch current, and gate drive output clamping for external power MOSFET protection.

With added system open loop protection feature, OB6561P shuts down system when the feedback loop is open.

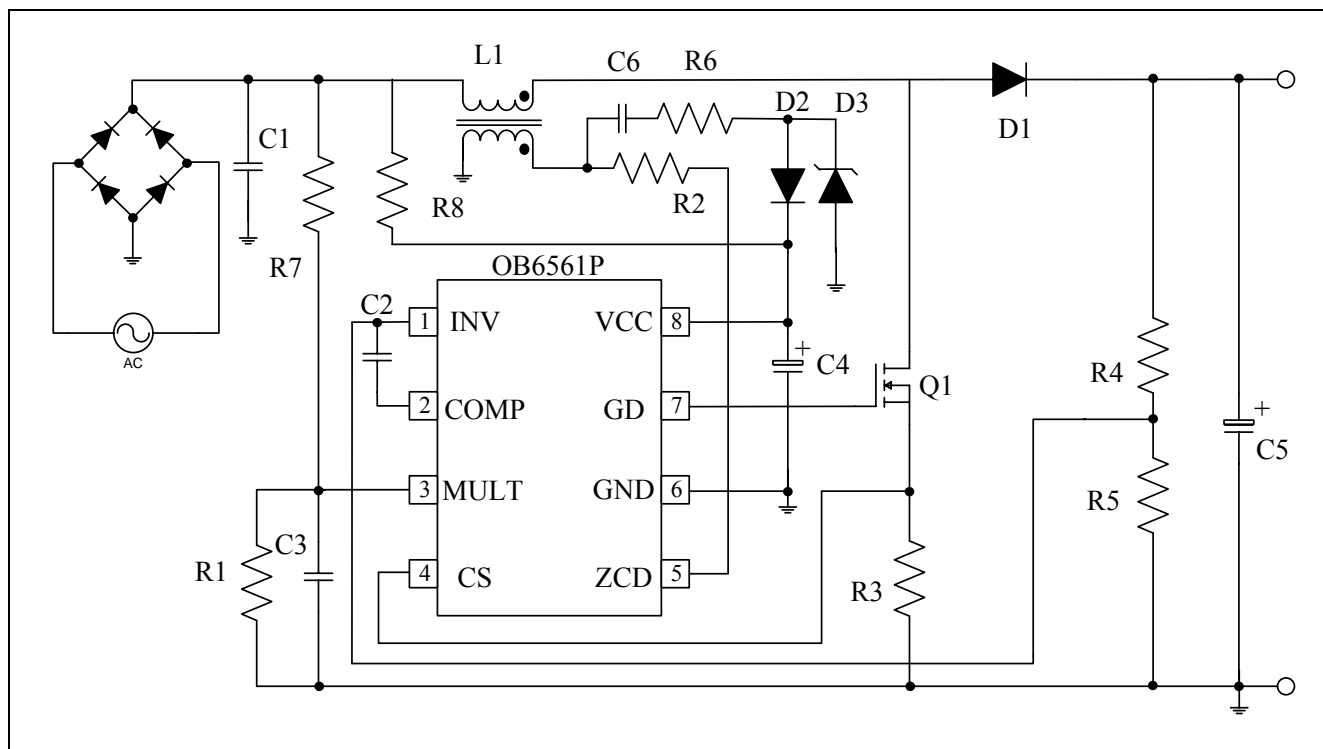

FEATURES

- Transition Mode (TM) Operation
- One quadrant multiplier with THD optimizer
- Low Start-up Current and Operating Current
- Cycle-by-Cycle Current Limiting
- Internal RC Filter
- Trimmed 1.5% Internal Bandgap Reference
- Under Voltage Lockout with Hysteresis
- Dynamic and Static Output Over-Voltage Protection (OVP)
- Internal Start-up Timer for Stand-alone Applications
- Disable Function
- Totem Pole Output with High State Clamping
- System Open Loop Protection
- Audio Noise Free
- 9.5V to 28V wide range of VCC voltage

APPLICATIONS

- Electronic Ballast
- AC-DC SMPS

TYPICAL APPLICATION

GENERAL INFORMATION

Terminal Assignment

In SOP8 or DIP8 Package.

Package Dissipation Rating

Package	R θ JA (C/W)
DIP8	90
SOP8	150

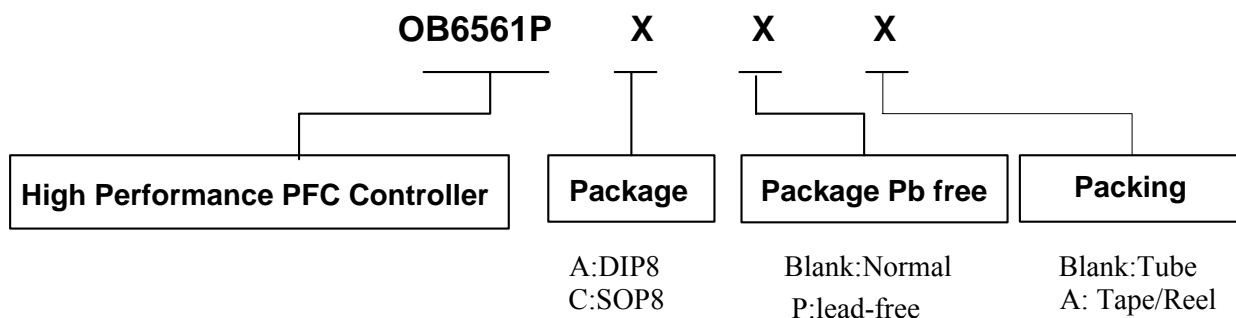

Absolute Maximum Ratings

Symbol	Parameter	Value
VCC	DC Supply voltage	30 V
I _{ZCD}	Zero Current Detector Max. Current	50mA(source) -10mA(sink)
CS INV COMP MULT	Analog inputs & outputs	-0.3 to 7V
T _j	Min/Max Operating Junction Temperature	-20 to 150 °C
T _{stg}	Min/Max Storage Temperature	-55 to 150 °C
Lead Temperature	(Soldering, 10secs)	260 °C

Ordering Information

Part Number	Description
OB6561PAP	8 Pin DIP, Pb free in Tube
OB6561PCP	8 Pin SOP, Pb free in Tube
OB6561PCPA	8 Pin SOP, Pb free in T&R

Note: Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.

TERMINAL DESCRIPTIONS

Pin Num	Pin Name	I/O	Description
1	INV	I	Inverting Input of Error Amplifier. Connected to Resistor Divider from System Output. This pin is also used for system open loop protection.
2	COMP	O	Output of Error Amplifier. A feedback compensation network is placed between COMP and the INV pin.
3	MULT	I	Input of Multiplier. Connected to Line Voltage after Bridge Diodes via A Resistor Divider to Provide Sinusoidal Reference Voltage to the Current Loop.
4	CS	I	Current Sense Input Pin. Connected to MOSFET Current Sensing Node.
5	ZCD	I	Zero Current Detection Input. When Activated, A New Switching Cycle Starts. If it is connected to GND, the device is disabled.
6	GND	P	Ground Pin
7	GD	O	Gate driver output. Drive Power MOSFET.
8	VCC	P	DC Supply Voltage.

Multiplier Characterization

OPERATIONAL DESCRIPTION

OB6561P is a highly integrated power factor correction (PFC) controller IC. The transition mode control greatly reduces the switch turn-on loss, improves the conversion efficiency and provides very good power factor correction.

• Error Amplifier

Connected to a resistor divider from output line, the inverting input of the Error Amplifier (E/A) is compared to an internal reference voltage (2.5V) to set the regulation on output voltage.

The E/A output is internally connected to the multiplier input and externally connected for loop compensation. It is usually realized with a capacitor which connected between the inverting input and EA output. The system loop bandwidth is set below 20 Hz to suppress the AC ripple of the line voltage.

• Multiplier

The one quadrant multiplier output limits the MOSFET peak current with respect of the system output voltage and the AC half wave rectified input voltage. Through controlling the CS comparator threshold as the AC line voltage traverses sinusoidally from zero to peak line voltage, the PFC preconverter's load appears to be resistive to the AC line.

In OB6561P, the two inputs for the multiplier are designed to achieve good linearity over a wide dynamic range to represent an AC line free from distortion. Special efforts have been made to assure universal line applications with respect to a 90 to 264 VAC range.

The multiplier output is internally clamped to 1.7V. So the MOSFET is protected against critical operation during start up.

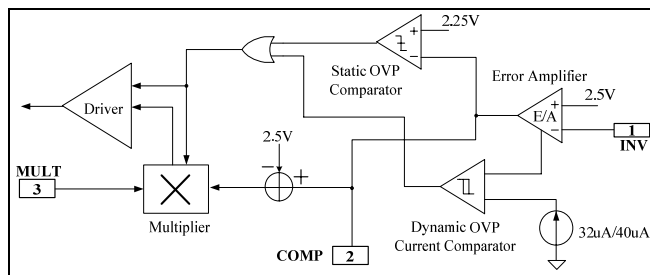

• Over Voltage Protection

Limited by low loop bandwidth setting, detection of output OVP could become very slow in regular approach. OB6561P offers two level OVP protection including dynamic OVP for output fast transient protection and static OVP for output steady-state protection.

In an output transient OVP event, current in proportion to ΔV flows into Error Amplifier output COMP through compensation network. When this current reaches 32uA, the output of multiplier is forced to decrease and on-time of MOSFET is reduced. When current continues to exceed 40uA, the power MOSFET is turned off until the

current falls below $\sim 10\mu A$. In this way, the system output cannot reach to a very high value.

When OVP event lasts long enough, the Error Amplifier Output, COMP, will saturate and stay low. Static OVP comparator is activated and power MOSFET Gate is off when COMP voltage is dropped below 2.25V. Normal operation is resumed when Error Amplifier goes back to its linear region after output voltage drops.

Over-voltage protection block

• Startup Current and Start up Control

The typical startup current of OB6561P is 35uA when the VCC pin is lower than the UVLO threshold so that VCC could be charged up and start up the device. A high value, low wattage startup resistor can therefore be used to minimize the power loss during the normal operation.

• Current Sensing Comparator and Leading Edge Blanking

Cycle-by-cycle current limiting is provided in OB6561P's peak current mode control. The switch current is detected by a sense resistor into the sense pin. The multiplier output voltage is compared with this sense voltage through an internal comparator. An internal RC filter is connected at the CS pin which smoothes the switch-on current spike. The remaining switch-on spike is blanked out via an internal leading edge blanking (LEB) circuit. Another extra function of LEB is that it limits the system minimum on time, thus the THD of system at light load will be decreased. The RS flip-flop ensures that only one single switch-on and switch-off pulse appears at the gate drive output during a given cycle.

• Zero Current Detection

OB6561P can perform zero current detection by using an auxiliary winding of the inductor. When the stored

energy is fully released to the output, the voltage at ZCD decrease. A new switching cycle is initiated following the ZCD triggering. The turn on of power MOSFET is initiated at moment that the inductor's current reaches zero.

- **Disable Function**

When the ZCD pin is pulled low, OB6561P is disabled and some internal functional blocks are turned off. The operation current is very small under this condition until the ZCD pin is released.

- **Gate Drive Output**

The output stage is designed to ensure zero cross-conduction current. This minimizes heat dissipation, increase efficiency, and enhance reliability. The output driver is also slew rate controlled to minimize EMI. The built-in 16V clamp at the gate output protects the MOSFET gate from high voltage stress.

- **Protection Controls**

OB6561P ensures good reliability design through its good protection coverage. Output dynamic and static over-voltage protection (OVP), VCC under voltage lockout (UVLO), cycle-by-cycle current limiting and output gate clamp are standard features provided by OB6561P.

- **System Open Loop Protection**

A new function of system open loop protection is provided in OB6561P. The voltage at INV pin is sensed. If INV pin is below 0.25V typical, the switching will be stopped. In this way, the system output voltage cannot increase too high (only the rectified line voltage), and the pre-converter will be protected from damage.
