Design

# OPAx340 Single-Supply, Rail-to-Rail Operational Amplifiers MicroAmplifier ${ }^{\text {TM }}$ Series 

## 1 Features

- Rail-to-Rail Input
- Rail-to-Rail Output (Within 1 mV )
- MicroSize Packages
- Wide Bandwidth: 5.5 MHz
- High Slew Rate: $6 \mathrm{~V} / \mu \mathrm{s}$
- Low THD + Noise: $0.0007 \%$ ( $f=1 \mathrm{kHz}$ )
- Low Quiescent Current: $750 \mu \mathrm{~A} /$ Channel
- Single, Dual, and Quad Versions

## 2 Applications

- Driving A/D Converters
- PCMCIA Cards
- Data Acquisition
- Process Control
- Audio Processing
- Communications
- Active Filters
- Test Equipment

## 3 Description

The OPA340 series rail-to-rail CMOS operational amplifiers are optimized for low-voltage, single-supply operation. Rail-to-rail input and output and highspeed operation make them ideal for driving sampling analog-to-digital (A/D) converters. They are also wellsuited for general purpose and audio applications as well as providing I/V conversion at the output of digital-to-analog (D/A) converters. Single, dual, and quad versions have identical specifications for design flexibility.

The OPA340 series operate on a single supply as low as 2.5 V with an input common-mode voltage range that extends 500 mV below ground and 500 mV above the positive supply. Output voltage swing is to within 1 mV of the supply rails with a $100-\mathrm{k} \Omega$ load. These devices offer excellent dynamic response ( $\mathrm{BW}=5.5 \mathrm{MHz}, \mathrm{SR}=6 \mathrm{~V} / \mu \mathrm{s}$ ), yet quiescent current is only 750 A . Dual and quad designs feature completely independent circuitry for lowest crosstalk and freedom from interaction.
The single (OPA340) packages are the tiny 5 -pin SOT-23 surface mount, 8-pin SOIC surface mount, and 8 -pin DIP. The dual (OPA2340) comes in the miniature 8 -pin VSSOP surface mount, 8 -pin SOIC surface mount, and 8 -pin PDIP packages. The quad (OPA4340) packages are the space-saving 16-pin SSOP surface mount and 14 -pin SOIC surface mount. All are specified from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ and operate from $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$. A SPICE macromodel is available for design analysis.

| Device Information ${ }^{(1)}$ |  |  |
| :---: | :---: | :---: |
| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| OPA340 | SOT-23 (5) | $3.00 \mathrm{~mm} \times 3.00 \mathrm{~mm}$ |
| OPA340, OPA2340 | PDIP (8) | $9.81 \mathrm{~mm} \times 6.35 \mathrm{~mm}$ |
|  | SOIC (8) | $4.90 \mathrm{~mm} \times 3.91 \mathrm{~mm}$ |
| OPA2340 | VSSOP (8) | $3.00 \mathrm{~mm} \times 3.00 \mathrm{~mm}$ |
| OPA4340 | SOIC (14) | $8.65 \mathrm{~mm} \times 3.91 \mathrm{~mm}$ |
|  | SSOP (16) | $4.90 \mathrm{~mm} \times 3.90 \mathrm{~mm}$ |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| Voltage | Supply voltage |  | 5.5 | V |
| Votage | Signal input terminals ${ }^{(2)}$ | -0.5 | 0.5 | V |
|  | Signal input terminals ${ }^{(2)}$ |  | 10 | mA |
| Current | Output short circuit ${ }^{(3)}$ |  |  |  |
|  | Operating, $\mathrm{T}_{\mathrm{A}}$ | -55 | 125 |  |
| Temperature | Junction, $\mathrm{T}_{J}$ |  | 150 | ${ }^{\circ} \mathrm{C}$ |
|  | Storage, $\mathrm{T}_{\text {stg }}$ | -55 | 125 |  |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be current limited to 10 mA or less.
(3) Short-circuit to ground, one amplifier per package.

### 6.2 ESD Ratings

| VALUE |  | UNIT |  |
| :--- | :--- | :---: | :---: | :---: |
| $\mathrm{V}_{(\text {(ESD) })}$Electrostatic <br> discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | $\pm 600$ | V |
|  | Charged-device model (CDM), per JEDEC specification JESD22-C101 ${ }^{(2)}$ | $\pm 250$ |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|  | MIN | MAX |
| :--- | ---: | ---: |
| Uupply voltage | 2.7 | 5.5 |
| Specified temperature | -40 | V |

## 7 Detailed Description

### 7.1 Overview

The OPA340 series operational amplifiers are fabricated on a state-of-the-art, 0.6-micron CMOS process. These devices are unity-gain stable and suitable for a wide range of general-purpose applications. Rail-to-rail input and output make them ideal for driving sampling A/D converters. In addition, excellent AC performance makes them well-suited for audio applications. The class AB output stage is capable of driving $600-\Omega$ loads series and extends 500 mV beyond the supply. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications. Figure 23 shows the input and output waveforms for the OPA340 in unitygain configuration. Operation is from a single $5-\mathrm{V}$ supply with a $10-\mathrm{k} \Omega$ load connected to $\mathrm{V} / 2$. The input is a $5-$ $\mathrm{V}_{\text {PP }}$ sinusoid. Output voltage is approximately $4.98 \mathrm{~V}_{\text {PP }}$. Power-supply pins must be bypassed with $0.01-\mu \mathrm{F}$ ceramic capacitors.

Figure 23. Rail-to-Rail Input and Output

### 7.2 Functional Block Diagram

### 7.3 Feature Description

### 7.3.1 Operating Voltage

The OPA340 series operational amplifiers are fully specified from 2.7 V to 5 V . However, supply voltage may range from 2.5 V to 5.5 V . Parameters are ensured over the specified supply range-a unique feature of the OPA340 series. In addition, many specifications apply from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. Most behavior remains virtually unchanged throughout the full operating voltage range. Parameters which vary significantly with operating voltages or temperature are shown in the Typical Characteristics.

### 7.3.2 Rail-to-Rail Input

The input common-mode voltage range of the OPA340 series extends 500 mV beyond the supply rails. This extended range is achieved with a complementary input stage-an N -channel input differential pair in parallel with a P-channel differential pair. The N-channel pair is active for input voltages close to the positive rail, typically $(\mathrm{V}+)-1.3 \mathrm{~V}$ to 500 mV above the positive supply, while the P -channel pair is on for inputs from 500 mV below the negative supply to approximately $\left(\mathrm{V}_{+}\right)-1.3 \mathrm{~V}$. There is a small transition region, typically $(\mathrm{V}+)-1.5 \mathrm{~V}$ to $(\mathrm{V}+)-1.1 \mathrm{~V}$, in which both pairs are on. This $400-\mathrm{mV}$ transition region can vary $\pm 300 \mathrm{mV}$ with process variation. Thus, the transition region (both stages on) can range from $(\mathrm{V}+)-1.8 \mathrm{~V}$ to $(\mathrm{V}+)-1.4 \mathrm{~V}$ on the low end, up to $(\mathrm{V}+)-1.2 \mathrm{~V}$ to $(\mathrm{V}+)-0.8 \mathrm{~V}$ on the high end.
OPA340 series operational amplifiers are laser-trimmed to the reduce offset voltage difference between the N channel and P-channel input stages, resulting in improved common-mode rejection and a smooth transition between the N -channel pair and the P -channel pair. However, within the $400-\mathrm{mV}$ transition region PSRR, CMRR, offset voltage, offset drift, and THD may be degraded compared to operation outside this region.
A double-folded cascode adds the signal from the two input pairs and presents a differential signal to the class AB output stage. Normally, input bias current is approximately 200 fA ; however, input voltages exceeding the power supplies by more than 500 mV can cause excessive current to flow in or out of the input pins. Momentary voltages greater than 500 mV beyond the power supply can be tolerated if the current on the input pins is limited to 10 mA . This current limiting is easily accomplished with an input resistor, as shown in Figure 24. Many input signals are inherently current-limited to less than 10 mA ; therefore, a limiting resistor is not required.

Copyright © 2016, Texas Instruments Incorporated
Figure 24. Input Current Protection for Voltages Exceeding the Supply Voltage

### 7.3.3 Rail-to-Rail Output

A class $A B$ output stage with common-source transistors is used to achieve rail-to-rail output. For light resistive loads ( $>50 \mathrm{k} \Omega$ ), the output voltage is typically a few millivolts from the supply rails. With moderate resistive loads ( $2 \mathrm{k} \Omega$ to $50 \mathrm{k} \Omega$ ), the output can swing to within a few tens of millivolts from the supply rails and maintain high open-loop gain (see Figure 15).

### 7.3.4 Capacitive Load and Stability

OPA340 series operational amplifiers can drive a wide range of capacitive loads. However, all operational amplifiers under certain conditions can become unstable. operational amplifier configuration, gain, and load value are some of the factors to consider when determining stability. An operational amplifier in unity-gain configuration is most susceptible to the effects of capacitive load. The capacitive load reacts with the output resistance of the operational amplifier, along with any additional load resistance, to create a pole in the small-signal response that degrades the phase margin. In unity-gain configuration, the OPA340 series operational amplifiers perform well, with a pure capacitive load up to approximately 1000 pF . Increasing gain enhances the amplifier ability to drive more capacitance (see Figure 21).

## Feature Description (continued)

One method of improving capacitive load drive in the unity-gain configuration is to insert a $10-\Omega$ to $20-\Omega$ resistor in series with the output, as shown in Figure 25. This resistor significantly reduces ringing with large capacitive loads. However, if there is a resistive load in parallel with the capacitive load, it creates a voltage divider introducing a DC error at the output and slightly reduces output swing. This error can be insignificant. For instance, with $R_{L}=10 \mathrm{k} \Omega$ and $R_{S}=20 \Omega$, there is only an approximate $0.2 \%$ error at the output.

When used with the miniature package options of the OPA340 series, the combination is ideal for space-limited and low-power applications. For further information, consult the ADS7816 data sheet, 12-Bit High Speed Micro Power Sampling Analog-To-Digital Converter (SBAS061). With the OPA340 in a noninverting configuration, an RC network at the output of the amplifier can be used to filter high-frequency noise in the signal (see Figure 26). In the inverting configuration, filtering may be accomplished with a capacitor across the feedback resistor (see Figure 27).

Figure 25. Series Resistor in Unity-Gain Configuration Improves Capacitive Load Drive

### 7.3.5 Driving A/D Converters

The OPA340 series operational amplifiers are optimized for driving medium-speed (up to 100 kHz ) sampling A/D converters. However, they also offer excellent performance for higher speed converters. The OPA340 series provides an effective means of buffering the converter input capacitance and resulting charge injection while providing signal gain. Figure 26 and Figure 27 show the OPA340 driving an ADS7816. The ADS7816 is a 12-bit, micro-power sampling converter in the tiny 8 -pin VSSOP package.

Figure 26. OPA340 in Noninverting Configuration Driving ADS7816

## Feature Description (continued)

Figure 27. OPA340 in Inverting Configuration Driving ADS7816

Figure 28. Speech Bandpass Filter

### 7.4 Device Functional Modes

The OPAx340 has a single functional mode and is operational when the power-supply voltage is greater than $2.7 \mathrm{~V}( \pm 1.35 \mathrm{~V})$. The maximum power supply voltage for the OPAx340 is $5.5 \mathrm{~V}( \pm 2.75 \mathrm{~V})$.

## 8 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The OPAx340 amplifier is a single-supply, CMOS operational amplifier with $5.5-\mathrm{MHz}$ unity-gain bandwidth and supply current of $950 \mu \mathrm{~A}$. Its performance is optimized for low-voltage ( 2.7 V to 5.5 V ), single-supply applications, with its input common-mode voltage linear range extending 300 mV beyond the rails and the output voltage swing within 5 mV of either rail. The OPAx340 series features wide bandwidth and unity-gain stability with rail-torail input and output for increased dynamic range. Power-supply pins must be bypassed with 0.01- $\mathrm{\mu}$ F ceramic capacitors.

### 8.2 Typical Applications

### 8.2.1 Single-Pole, Low-Pass Filter

Figure 29 shows the OPA340 in a typical noninverting application with the input signal bandwidth limited by the input lowpass filter.

Figure 29. Single-Pole, Low-Pass Filter
Equation 1 through Equation 2 show calculations for corner frequency and gain:

$$
\begin{align*}
& \mathrm{f}_{-3 \mathrm{~dB}}=\frac{1}{2 \pi \mathrm{R}_{1} \mathrm{C}_{1}}  \tag{1}\\
& \frac{\mathrm{~V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}}=\left(1+\frac{R_{\mathrm{F}}}{\mathrm{R}_{\mathrm{G}}}\right)\left(\frac{1}{1+\mathrm{sR} \mathrm{R}_{1} \mathrm{C}_{1}}\right) \tag{2}
\end{align*}
$$

## Typical Applications (continued)

### 8.2.1.1 Design Requirements

When receiving low-level signals, limiting the bandwidth of the incoming signals into the system is often required. The simplest way to establish this limited bandwidth is to place an RC filter at the noninverting terminal of the amplifier, as shown in Figure 29. If a steeper attenuation level is required, a two-pole or higher-order filter may be used.

### 8.2.1.2 Detailed Design Procedure

The design goals for this circuit include these parameters:

- A noninverting gain of $10 \mathrm{~V} / \mathrm{V}(20 \mathrm{~dB})$
- Design a single-pole response circuit with $-3-\mathrm{dB}$ rolloff at 15.9 kHz and 159 Hz
- Modify the design to increase attenuation level to $-40 \mathrm{~dB} /$ decade (Sallen-Key Filter)

Use these design values:

- $\mathrm{C}_{1}=0 \mathrm{nF}, 10 \mathrm{nF}, 1 \mu \mathrm{~F}$
- $R_{1}=1 \mathrm{k} \Omega$
- $\mathrm{R}_{\mathrm{G}}=10 \mathrm{k} \Omega$
- $R_{F}=90 \mathrm{k} \Omega$

Figure 30 shows how the output voltage of OPA340 changes over frequency depending on the value of $\mathrm{C}_{1}$ with a constant $R_{1}$ of $1 \mathrm{k} \Omega$. Without any filtering of the input signal ( $C_{1}=0$ ), the $-3-d B$ effective bandwidth is a function of the OPA340 unity-gain bandwidth and closed-loop gain, $\mathrm{f}_{(-3 \mathrm{~dB})}=U G B W / A_{C L}$, where $A_{\mathrm{CL}}$ is closed-loop gain and UGBW denotes unity-gain bandwidth. Thus, for a closed-loop gain $=10, \mathrm{f}_{(-3 \mathrm{~dB})}=1 \mathrm{MHz} / 10=100 \mathrm{kHz}$; see Figure 30.
To further limit the output bandwidth, an appropriate choice of $\mathrm{C}_{1}$ must be made: for $\mathrm{C}_{1}=10 \mathrm{nF}$, $\mathrm{f}_{\mathrm{C}}=\frac{1}{2 \pi \times \mathrm{R}_{1} \mathrm{C}_{1}}=\frac{1}{2 \pi \times 1^{3} \times 1^{-8}}=15.9 \mathrm{kHz}$.
To further limit the bandwidth, a larger $\mathrm{C}_{1}$ must be used: choosing $\mathrm{C}_{1}=1 \mu \mathrm{~F}$,
$\mathrm{f}_{\mathrm{C}}=\frac{1}{2 \pi \times \mathrm{R}_{1} \mathrm{C}_{1}}=\frac{1}{2 \pi \times 1^{3} \times 1^{-6}}=159 \mathrm{~Hz}$ (see Figure 30).

### 8.2.1.3 Application Curve

Figure 30. OPA340 Single-Pole AC Gain vs Frequency Response

## Typical Applications (continued)

### 8.2.2 Two-Pole, Low-Pass Filter

If even more attenuation is required, a multiple pole filter is required. The Sallen-Key filter may be used for this task, as shown in Figure 31. For best results, the amplifier must have effective bandwidth that is at least 10 times higher than the filter cutoff frequency. Failure to follow this guideline results in a phase shift of the amplifier, which in turn leads to lower precision of the filter bandwidth. Additionally, to minimize the loading effect between multiple RC pairs on overall the filter cutoff frequency, choose $R=10 \times R_{1}$ and $C_{2}=C 1 / 10$; see Figure 32 .

Figure 31. Two-Pole, Lowpass Filter
Equation 3 through Equation 5 show calculations for corner frequency and gain:

$$
\begin{align*}
& \mathrm{f}_{\mathrm{C}}=\frac{1}{2 \pi \sqrt{\mathrm{R}_{1} \mathrm{C}_{1} \mathrm{R}_{2} \mathrm{C}_{2}}}  \tag{3}\\
& \frac{\mathrm{~V}_{\text {OUT }(\mathrm{s})}}{\mathrm{V}_{\operatorname{IN}(\mathrm{s})}}=\frac{\mathrm{G}\left(2 \pi \mathrm{f}_{\mathrm{c}}\right)^{2}}{\mathrm{~s}^{2}+2 \zeta\left(2 \pi \mathrm{f}_{\mathrm{c}}\right) \mathrm{s}+\left(2 \pi \mathrm{f}_{\mathrm{c}}\right)^{2}}  \tag{4}\\
& \mathrm{G}=\frac{\mathrm{R}_{\mathrm{G}}+\mathrm{R}_{\mathrm{F}}}{\mathrm{R}_{\mathrm{G}}} \tag{5}
\end{align*}
$$

### 8.2.2.1 Detailed Design Procedure

Use these design values:

- $\mathrm{C}_{1}=10 \mathrm{nF}$ and $\mathrm{C}_{2}=1 \mathrm{nF}$
- $R_{1}=1 \mathrm{k} \Omega$ and $R_{2}=10 \mathrm{k} \Omega$
- $\mathrm{R}_{\mathrm{G}}=10 \mathrm{k} \Omega$
- $R_{F}=90 \mathrm{k} \Omega$

Figure 32 shows the Sallen-Key filter second-order response for different $R C$ values: for $R$ and $C$ values above, $\mathrm{f}_{\mathrm{C}}=\frac{1}{2 \pi \sqrt{\mathrm{R}_{1} \mathrm{C}_{1} \mathrm{R}_{2} \mathrm{C}_{2}}}=\frac{1}{2 \pi \sqrt{1^{3} \times 1^{-8} \times 1^{4} \times 1^{-9}}}=15.9 \mathrm{kHz}$.
To further limit the bandwidth, a larger RC value must be used: increasing C values 100 times, such as $\mathrm{C}_{1}=1{ }_{1}^{\mu \mathrm{F}}$ and $\mathrm{C}_{2}=0.1 \mu \mathrm{~F}$, with unchanged resistors, results in the second-order rolloff at $\mathrm{f}_{\mathrm{C}}=\frac{1}{2 \pi \sqrt{\mathrm{R}_{1} \mathrm{C}_{1} \mathrm{R}_{2} \mathrm{C}_{2}}}=\frac{1}{2 \pi \sqrt{1^{3} \times 1^{-6} \times 1^{4} \times 1^{-7}}}=159 \mathrm{~Hz}$. See Figure 32.

## Typical Applications (continued)

### 8.2.2.2 Application Curve

Figure 32. OPA340 Two-Pole, Lowpass Sallen-Key AC Gain vs Frequency Response

## 9 Power Supply Recommendations

The OPAx340 is specified for operation from 2.7 V to $5.5 \mathrm{~V}( \pm 1.35 \mathrm{~V}$ to $\pm 2.75 \mathrm{~V})$.

## CAUTION

Supply voltages larger than 7 V can permanently damage the device (see the Absolute Maximum Ratings).

Tl recommends placing $0.1-\mu \mathrm{F}$ bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies.

## 10 Layout

### 10.1 Layout Guidelines

Pay attention to good layout practices. Keep traces short and when possible, use a printed-circuit board (PCB) ground plane with surface-mount components placed as close to the device pins as possible. Place a $0.1-\mu \mathrm{F}$ capacitor closely across the supply pins. Apply these guidelines throughout the analog circuit to improve performance and provide benefits, such as reducing the electromagnetic interference (EMI) susceptibility.

Operational amplifiers vary in susceptibility to radio frequency interference (RFI). RFI can generally be identified as a variation in offset voltage or DC signal levels with changes in the interfering RF signal. The OPA340 is specifically designed to minimize susceptibility to RFI and demonstrates remarkably low sensitivity compared to previous generation devices. Strong RF fields can still cause varying offset levels.

## 11 Device and Documentation Support

### 11.1 Device Support

### 11.1.1 Development Support

### 11.1.1.1 TINA-TITM (Free Software Download)

TINA ${ }^{\text {TM }}$ is a simple, powerful, and easy-to-use circuit simulation program based on a SPICE engine. TINA-TITM is a free, fully-functional version of the TINA software, preloaded with a library of macro models in addition to a range of both passive and active models. TINA-TI provides all the conventional DC, transient, and frequency domain analysis of SPICE, as well as additional design capabilities.
Available as a free download from the Analog eLab Design Center, TINA-TI offers extensive post-processing capability that allows users to format results in a variety of ways. Virtual instruments offer the ability to select input waveforms and probe circuit nodes, voltages, and waveforms, creating a dynamic quick-start tool.

## NOTE

These files require that either the TINA software (from DesignSoft ${ }^{T M}$ ) or TINA-TI software be installed. Download the free TINA-TI software from the TINA-TI folder.

### 11.1.1.2 DIP Adapter EVM

The DIP Adapter EVM tool provides an easy, low-cost way to prototype small surface mount ICs. The evaluation tool these TI packages: D or U (SOIC-8), PW (TSSOP-8), DGK (MSOP-8), DBV (SOT23-6, SOT23-5 and SOT23-3), DCK (SC70-6 and SC70-5), and DRL (SOT563-6). The DIP Adapter EVM may also be used with terminal strips or may be wired directly to existing circuits.

### 11.1.1.3 Universal Operational Amplifier EVM

The Universal Op Amp EVM is a series of general-purpose, blank circuit boards that simplify prototyping circuits for a variety of IC package types. The evaluation module board design allows many different circuits to be constructed easily and quickly. Five models are offered, with each model intended for a specific package type. PDIP, SOIC, MSOP, TSSOP and SOT23 packages are all supported.

## NOTE

These boards are unpopulated, so users must provide their own ICs. TI recommends requesting several operational amplifier device samples when ordering the Universal Op Amp EVM.

### 11.1.1.4 TI Precision Designs

TI Precision Designs are analog solutions created by Tl's precision analog applications experts and offer the theory of operation, component selection, simulation, complete PCB schematic and layout, bill of materials, and measured performance of many useful circuits. TI Precision Designs are available online at http://www.ti.com/ww/en/analog/precision-designs/.

### 11.1.1.5 WEBENCH ${ }^{\circledR}$ Filter Designer

WEBENCH® Filter Designer is a simple, powerful, and easy-to-use active filter design program. The WEBENCH Filter Designer lets you create optimized filter designs using a selection of TI operational amplifiers and passive components from Tl's vendor partners.
Available as a web-based tool from the WEBENCH® Design Center, WEBENCH® Filter Designer allows you to design, optimize, and simulate complete multistage active filter solutions within minutes.

### 11.2 Documentation Support

### 11.2.1 Related Documentation

For related documentation, see the following application reports and publications (available for download from www.ti.com):

- 12-Bit High Speed Micro Power Sampling Analog-To-Digital Converter (SBAS061)
- A Dual-Polarity, Bidirectional Current-Shunt Monitor (SLYT311)

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free"
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

| OPA4340UAG4 | D | SOIC | 14 | 50 | 506.6 | 8 | 3940 | 4.32 |

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Refernce JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
5. Support pin may differ or may not be present.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

D (R-PDSO-G14)
PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $0.006(0,15)$ each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed $0.017(0,43)$ each side.
E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed . 006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 inch, per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MO-137, variation AB.

SOLDER MASK DETAILS

## NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON . 005 INCH [0.127 MM] THICK STENCIL
SCALE:8X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
$P(R-P D I P-T 8)$
PLASTIC DUAL-IN-LINE PACKAGE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Falls within JEDEC MS-001 variation BA.

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
D Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
E. Falls within JEDEC MO-187 variation AA, except interlead flash.

## DGK (S-PDSO-G8)

## PLAStic SmALL OUTLINE PACKAGE

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
