SIEMENS

GHz PLL with I^2C Bus and Four Chip Addresses

SDA 3302 Family

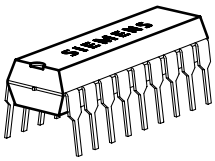
Preliminary Data

Bipolar IC

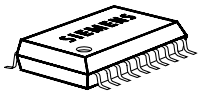
Features

- 1-chip system for MPU control (I^2C bus)
- 4 programmable chip addresses
- Short pull-in time for quick channel switch-over and optimized loop stability
- Charge pump output with switch off option
- Up to 3*) high current band switch outputs (20 mA)
- Up to 4*) output ports (5 mA)

*) depending on version



P-DIP-18-5



P-DSO-20-1

P-DSO-16-1

SDA 3302-5X	Q67006-H5111	P-DSO-20-1 Tape & Reel (SMD)
SDA 3302-5X6	Q67006-H5110	P-DSO-16-1 Tape & Reel (SMD)

Functional Description

Combined with a VCO (tuner) the SDA 3302 device, with four hardware-switched chip addresses, forms a digitally programmable phase-locked loop for use in television sets with PLL frequency-synthesis tuning.

The PLL permits precise crystal-controlled setting of the frequency of the tuner oscillators between 16 and 1300 MHz in increments of 62.5 kHz. The tuning process is controlled by a microprocessor via an I^2C bus. The crystal oscillator generates a sinusoidal signal suppressing the higher-order harmonics, which reduces the moiré noise considerably.

Circuit Description

Tuning Section (refer to block diagram)

UHF/VHF

REF

Q1, Q2

The tuner signal is capacitively coupled at the UHF/VHF input and subsequently amplified. The reference input REF should be decoupled to ground using a capacitor of low series inductance. The signal passes through an asynchronous divider with a fixed ratio of P = 8, an adjustable divider with ratio N = 256 through 32767 and is then compared in a digital phase/frequency detector to a reference frequency f_{REF} of 7.8125 kHz. The latter is derived from a balanced, low-impedance 4 MHz crystal oscillator (pin Q1, Q2), whose output signal is divided by Q = 512.

The phase detector has two outputs UP and DOWN that drive the two current sources I+ and I– of a charge pump. If the negative edge of the divided VCO signal appears prior to the negative edge of the reference signal, the I+ current source pulses for the duration of the phase difference. In the reverse case the I– current source pulses.

PD, UD

When the two signals are in phase, the charge-pump output (PD) goes high-impedance (PLL is locked). An active low-pass filter integrates the current pulses to generate the tuning voltage for the VCO (internal amplifier an external transistor at the UD output and an external RC circuitry). The charge-pump output can also be set to high-impedance state when control bit T0 = 1. Here it should be noted, however, that the tuning voltage can alter over a long period in the high-impedance state as a result of self-discharge in the peripheral circuitry. UD can be disconnected internally by the control bit OS to enable external adjustments.

By means of a control bit 5I the pump current can be switched between two values by software. This switchover permits alteration of the control response of the PLL in the locked-in state. In this way different VCO gains in the different TV bands can be compensated for example.

Circuit Description (cont'd)

P0-P2 The software-switched outputs (P0, P1, P2) can be used for direct band selection (20-mA current output).

P4-P7 P4, P5, P6 and P7 are open-collector outputs for a variety of different purposes. The test bit T1 = 1 switches the test signals f_{REF} (4 MHz/512) and Cy (divided input signal) to P6 and P7.

CAS Four different chip addresses can be set by appropriate connection of pin CAS.

I^2C-Bus Interface

SCL, SDA Data are exchanged between the processor and the PLL on the I^2C bus. The clock is produced by the processor (input SCL), while pin SDA works as an input or output depending on the direction of the data (open collector; external pullup resistor). Both inputs have hysteresis and a lowpass characteristic, which enhances the noise immunity of the I^2C bus.

The data from the processor are applied to an I^2C bus controller and filed in registers according to their function. When the bus is free, both lines are in the marking state (SDA, SCL are high). Each telegram begins with a start condition and ends with the stop condition. Start condition: SDA goes low while SCL remains high; stop condition: SDA goes high while SCL remains high. All further data exchanges occur while SCL is low and are accepted by the controller with the positive clock edge.

For what follows, refer to the table of logic allocations.

All telegrams are transmitted byte by byte, followed by a ninth clock pulse, during which the controller puts the SDA line on low (acknowledge condition). The first byte consists of seven address bits, with which the processor selects the PLL from a number of peripheral devices (chip select). The eighth bit is always low. In the data portion of the telegram the first bit of the first or third data byte determines whether a divider ratio or control information follows. In each case the byte following the first byte must be of the same data type (or a stop condition).

V_S, GND When the supply voltage is applied, a power-on reset circuit prevents the PLL from putting the SDA line on low, which would block the bus.

Circuit Description (cont'd)

Logic Allocations

	MSB								A = Acknowledge
Address byte	1	1	0	0	0	MA1	MA0	0	A
Prog. divider byte 1	0	n14	n13	n12	n11	n10	n9	n8	A
Prog. divider byte 2	n7	n6	n5	n4	n3	n2	n1	n0	A
Control info. byte 1	1	5I	T1	T0	1	1	1	OS	A
Control info. byte 2	P7	P6	P5	P4	X	P2	P1	P0	A

Divider Ratio

N = 16384 × n14 + 8192 × n13 + 4096 × n12 + 2048 × n11 + 1024 × n10 + 512 × n9 + 256 × n8 + + 128 × n7 + 64 × n6 + 32 × n5 + 16 × n4 + 8 × n3 + 4 × n2 + 2 × n1 + n0

Band Selection

P2-P0 = 1 Open-collector output is active.

Port Outputs

P7-P4 = 1 Open-collector output is active.

Pump Current Switchover

5I = 1 High current.

UD Disable

OS = 1 V_D is disabled.

Test Mode

T1, T0 = 0,0 Normal mode

T1 = 1 P6 = f_{REF}; P7 = Cy

T0 = 1 Tristate charge pump PD is in high-impedance.

Application Circuit

Calculation of Loop Filter

Loop bandwidth $\omega_R = \sqrt{} (I_p \times K_{VCO}) / (C_1 \times P \times N)$

Attenuation: $\xi = 0.5 \times \omega_R \times R \times C_1$

P = prescaler
N = programmable divider
I_p = pump current
K_{VCO} = tuner slope
R, C_1 = loop filter

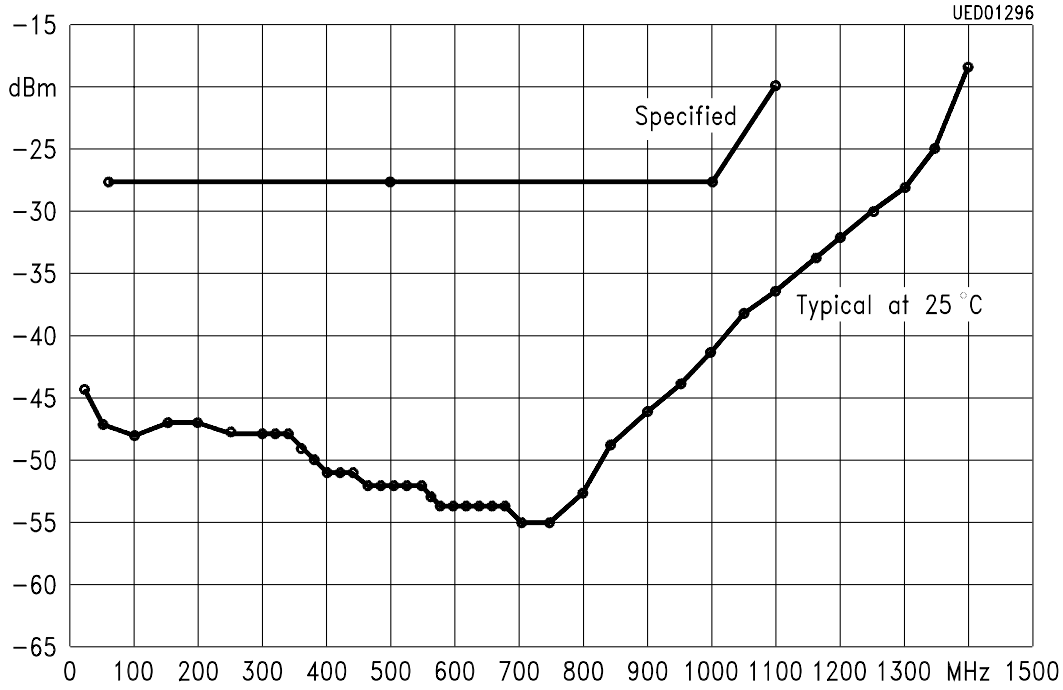
Example for channel 47:

P = 8, N = 11520, I_p = 100 µA; K_{VCO} = 18.7 MHz/V, R = 22 kΩ,
C_1 = 180 nF, ω_R = 336 Hz, f_r = 54 Hz, ξ = 0.67

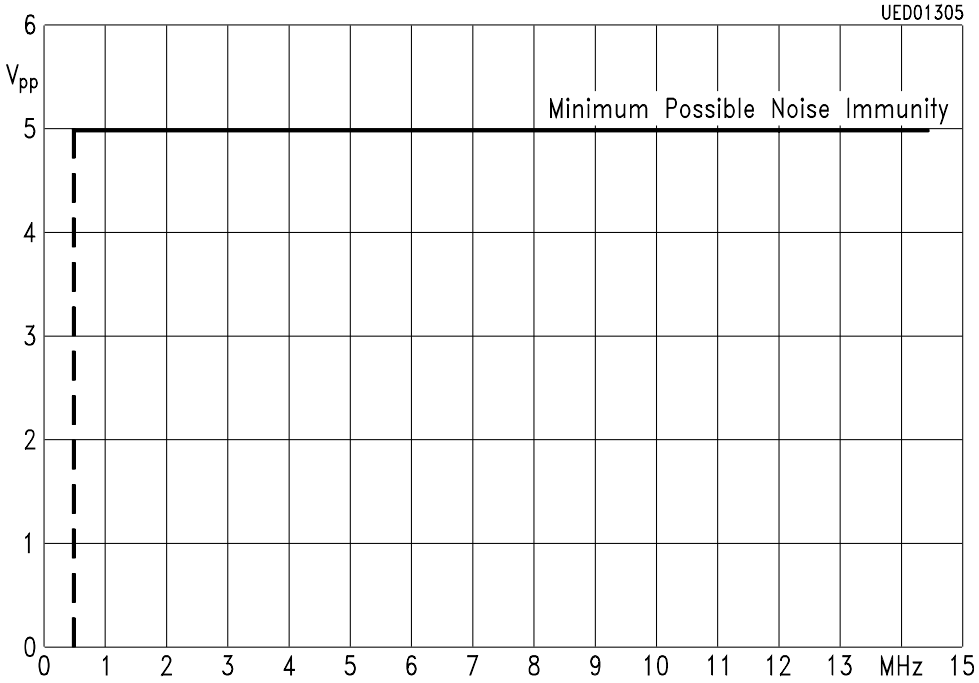
Standard dimensioning: $C_2 = C_{1/5}$

Note: The high-impedance port outputs and CAS can be blocked against external noise with a capacitor of 1 nF.

Input Sensitivity



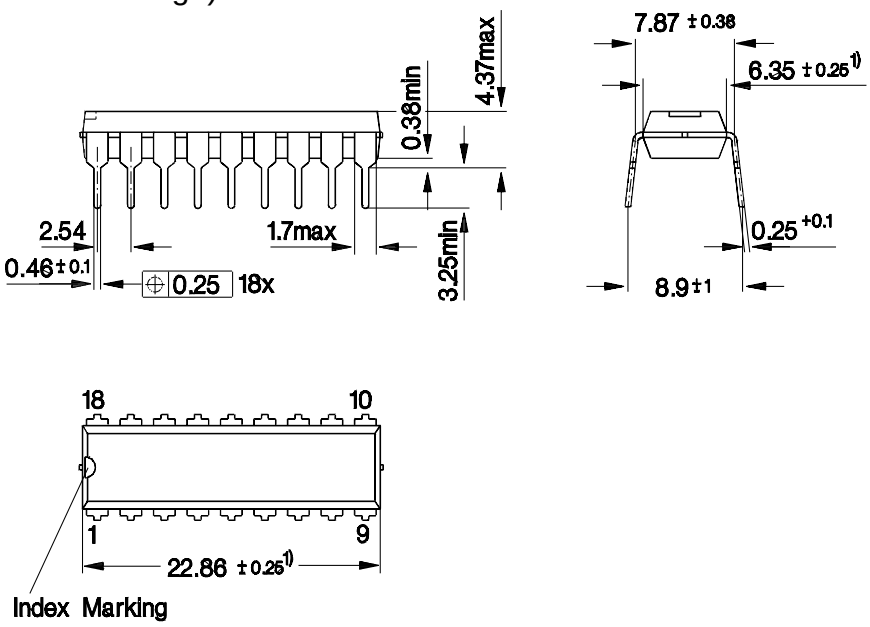
I²C Bus Noise Immunity



The sinusoidal noise pulses are applied via a coupling capacitance of 33 pF to SCL and SDA inputs.

Package Outlines

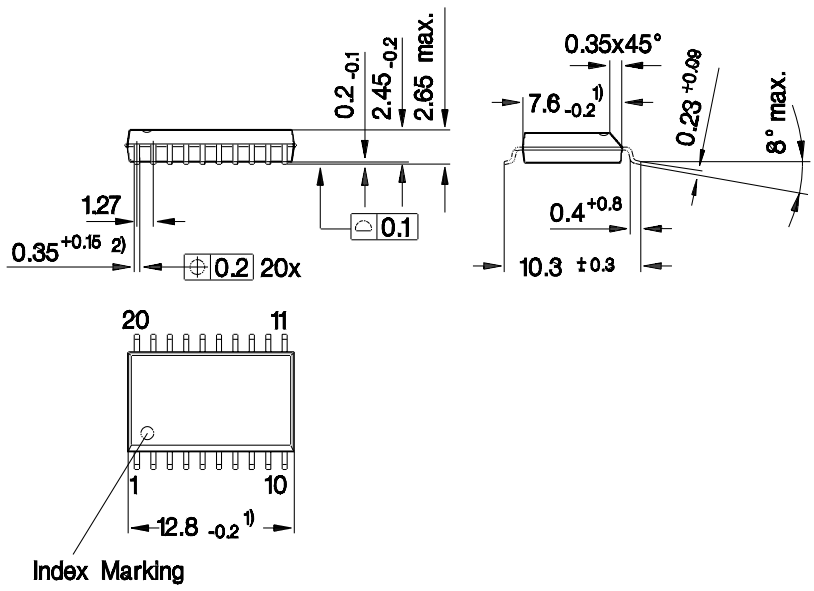
Plastic-Package, P-DIP-18-5
(Plastic Dual In-Line Package)



1) Does not include plastic or metal protrusion of 0.25 max. per side

GPD05586

Plastic-Package, P-DSO-20-1 (SMD)
(Plastic Dual Small Outline Package)



1) Does not include plastic or metal protrusion of 0.15 max. per side
2) Does not include dambar protrusion
