## APPLICATION CIRCUIT

### CAUTION

- Capacitive load should not be directly connected to output terminal to avoid instable operation.
- When closed loop voltage gain ( $G_V$ ) is set below 40dB, a series resistor more than  $1k\Omega$  connected to the output terminal is needed. Minimum closed loop voltage gain should be more than 21dB.
- About threshold level of S1 and S2, "H" level is above 0.9V, "L" level is below 0.3V.
